

# Prescripto Application Architecture & ERD

Generated from workspace code analysis

## 1. Overview

Prescripto is a telehealth booking platform with separate website, admin, and backend. It supports user registration/login, doctor listings, appointment booking, profile updates, and admin management of doctors and appointments.

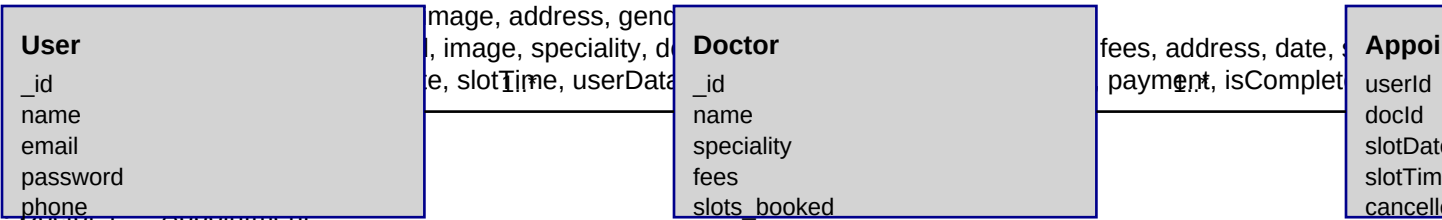

## 2. Backend Architecture

- Express API with /api/user, /api/admin, /api/doctor routes
- MongoDB via Mongoose models, with in-memory fallback when DB is unavailable
- JWT auth for users and admins; bcrypt password hashing

## 3. Frontend Architecture

- clientside/ for public website; admin/ for admin portal
- React + Vite + Tailwind CSS + Axios + React Router
- Context providers manage shared app state, auth, bookings, and admin actions

## 4. Database Models

- Appointment stores embedded `userData` and `docData` for booking snapshot details

## 6. Deployment & Environment

- Backend uses `MONGODB_URI` or default `prescripto` database
- Admin credentials are loaded from ENV variables
- Fallback in-memory storage supports demo mode when MongoDB is unavailable
